

# HPC and data requirements for weather, climate and air quality research

Francisco J. Doblas-Reyes  
BSC Earth Sciences Department

## What

Environmental modelling and forecasting

## Why

Our strength ...

- ... research ...
- ... operations ...
- ... services ...
- ... high resolution ...

## How

Develop a capability to model air quality processes from urban to global and the impacts on weather, health and ecosystems

Implement climate prediction system for subseasonal-to-decadal climate prediction

Develop user-oriented services that favour both technology transfer and adaptation

Use cutting-edge HPC and Big Data technologies for the efficiency and user-friendliness of Earth system models

Earth system services

Climate prediction

Atmospheric composition

Computational Earth sciences

# Air quality operational forecasts

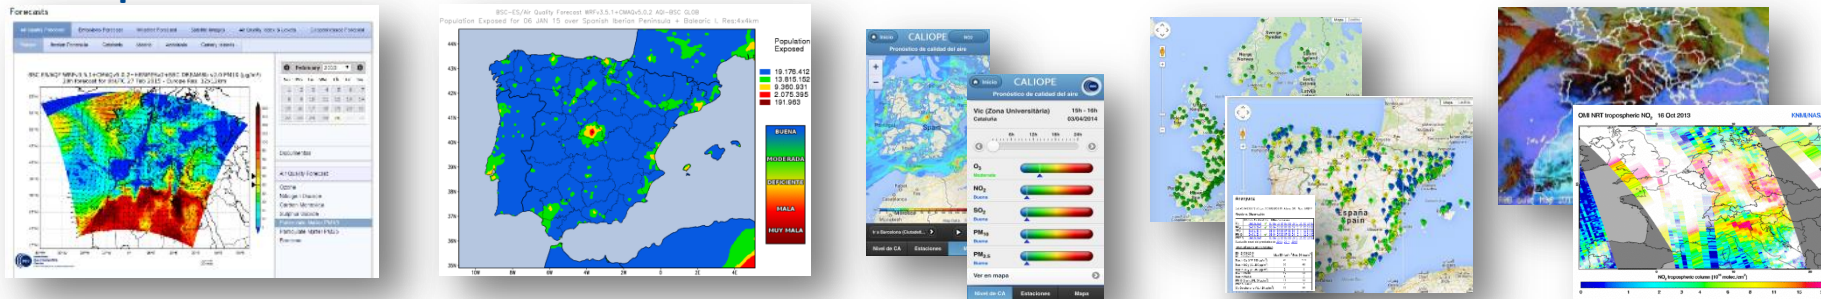

**Barcelona Supercomputing Center**  
Centro Nacional de Supercomputación

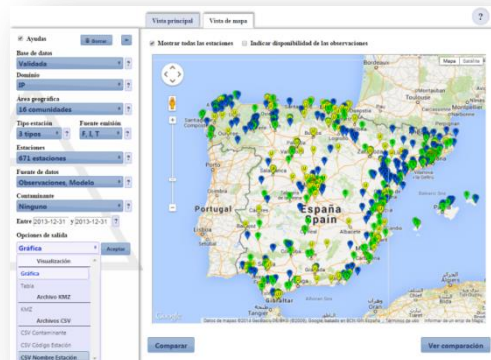

## AQF CALIOPE system: daily forecast and evaluation

### Forecast products

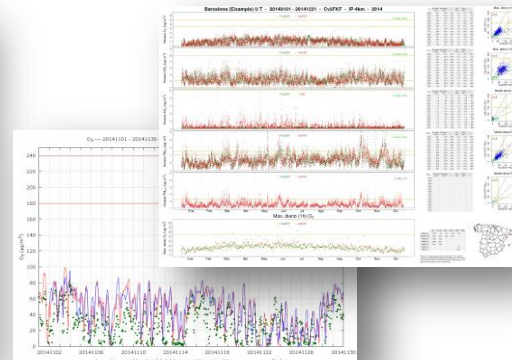

Daily forecast for **meteorology, emissions and air quality**: Europe (12km), Iberian Peninsula (4km), Andalusia, Catalonia and Madrid (1km), since 2007

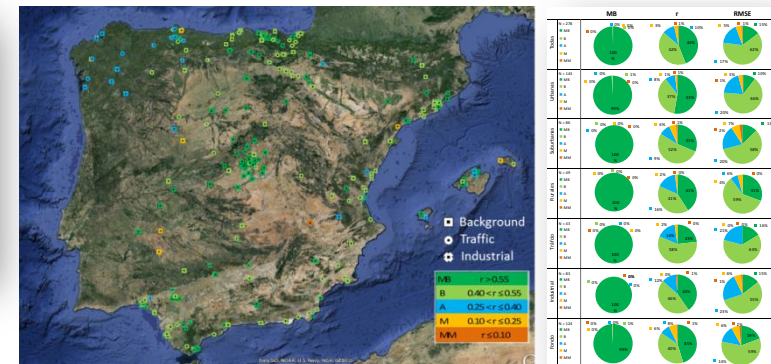

## Air quality database

## Near Real Time evaluation

## Annual evaluation by air quality stations

## Annual follow up

PM10\_KF annual average skill evolution (2011-2014)

## Rate of successfully completed simulations (%)

## VODAFONE

Ciudad conectada

[Vodafone.es/ciudad-conectada](http://Vodafone.es/ciudad-conectada)

## CALIOPE

Provides air quality forecasts for Vodafone's smart cities system

## CALIOPE

Has been awarded the MYGEOSS prize for creating an app with air quality forecasts for European cities

Centro Nacional de Supercomputación

Developed as part of the  
**RESILIENCE PROTOTYPE**  
in the EUPORIAS project

## SEASONAL WIND PREDICTIONS FOR THE ENERGY SECTOR

### WHY?

Weather forecasts predict future wind conditions only in the range of weeks. Climate predictions look at big changes over years and decades. However, for energy traders, wind farm managers and many others, it would be crucial to understand wind conditions in the next few months.

[LEARN MORE](#)

### HOW?

Based on sophisticated climate models, we are now able to provide new ways to forecast wind conditions in the next few months.

[LEARN MORE](#)

### TRY IT OUT

Our interactive browser application allows you to explore the data. Which regions might experience unusual changes in wind activity in the coming months? Find out what our models can tell you.

## To perform this user-driven research two things are needed

### HPC resources

- Access to computing (RES, PRACE)
- Optimisation of the community codes we develop

### Data management solutions

- Data analysis tools with reduced data traffic
- Streaming
- Efficient storage
- Visualisation

# Climate change is taking place

Centro Nacional de Supercomputación

Rank of the 2015 annual mean temperature over the last 37 years from ERA Interim.

Annual mean 2m temperature  
Rank of year 2015 (reference: 1979-2015)

Data: ERA-Interim. Figure: F. Massonnet - BSC

Climate models are made of coupled binaries representing the atmosphere, ocean, sea ice, land surface, etc.

Arctic sea-ice simulation with the NEMO/LIM ocean/sea-ice model for three different spatial resolutions.

ORCA2 (~2 degrees) - 01 Jan 1983

ORCA1 (~1 degree) - 01 Jan 1983

ORCA025 (~1/4 degree) - 01 Jan 1983

Climate prediction is a large problem that requires running hundred of parallel jobs independently.

Computational efficiency and a flexible workflow manager are key elements.

**High-resolution CMIP6 decadal prediction**

**5,500 simulated years**

**200 million CPU hours, 1.4 PB**

# Predicting extremes

Barcelona  
Supercomputing  
Center  
Centro Nacional de Supercomputación

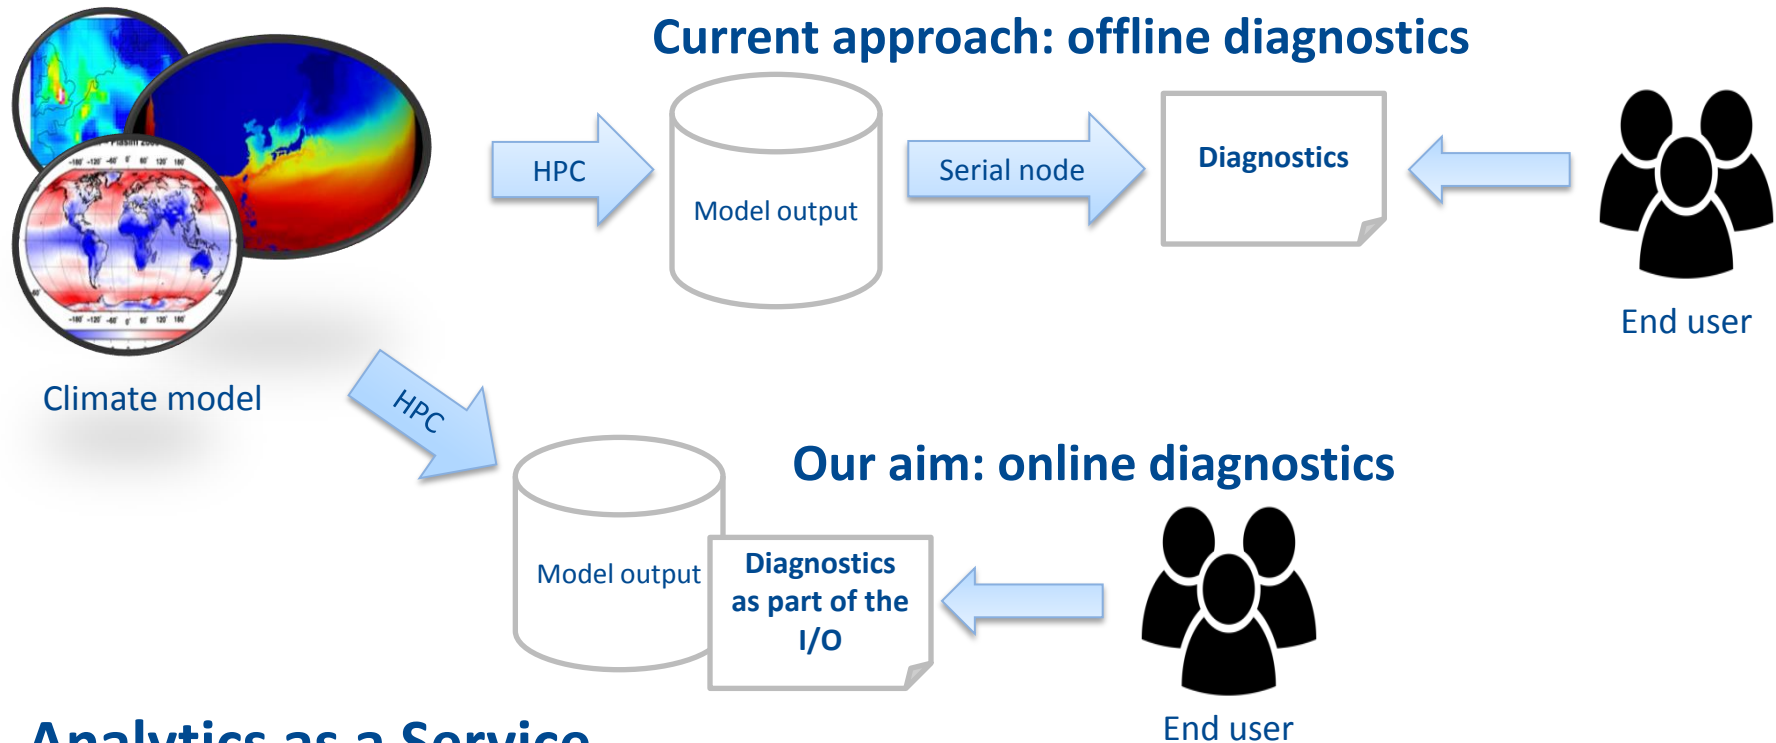

June-to-August near-surface temperature correlation difference between ensemble experiments with a climatological and realistic land-surface initialisation. Results for EC-Earth2.3 started in May over 1979-2010

Two ways for the analysis: online or offline  
Objective: reducing data traffic

## Analytics as a Service

- Diagnostics online during the run (either on compute node or elsewhere)
- Reduced data traffic and storage
- New diagnostics (data mining of extremes) possible
- The user gets the results faster → crucial to develop climate services (both public and private)

- **A new paradigm has come to stay: user-driven research**
- **Education:** in the era of open data, take advantage of the open education opportunities.
- **Heterogeneity:** link to and merge our data with communities with larger impact (urban, arts, social).
- **Technology:** make the most of a rapidly evolving technology (heterogeneous nodes, data software, mobile data capture, storage/compression, computing and storage outsourcing).
- **Industry engagement:** how can we solve the problem of involving more efficiently the private sector?
